Fold in half and cut on solid line to form two lift tabs and glue my information or write your information under the tabs

A natural hazard is an event in nature that can cause extensive damage to land and property, and that threatens human lives.

Most natural hazards are related to one of two energy sources—the Sun, or Earth’s hot core. Earth’s weather, driven by the Sun, is part of the *external energy system*.

Weather-related natural hazards include hurricanes, flooding, and slumping.
